

Difference Between SSD & Hard Disk:

SSD:

It is a Storage device that uses flash memory to store data. It is faster and more resistant to physical damage than a hard disk as it has no moving parts. Computers with SSDs usually start faster and applications open more quickly. For the same storage capacity, the SSDs are generally more expensive than hard disk.

Hard Disk (HDD):

It is a Storage device that uses spinning magnetic disks and a moving read/write head to store and access data. It is experienced to be slower than SSD and can make some noise as it uses its moving parts. HDDs are usually cheaper and provide large amounts of storage at a lower cost, making them a good choice for storing large files & backups.

Differences:

Feature	SSD	Hard Disk (HDD)
Speed	Faster	Slower
Storage	Flash memory	Magnetic disk
Moving Parts	No	Yes
Noise	Silent	Making some noise
Cost	More expensive	Cheaper
Durability	More durable	Less durable
